GLOBAL SCALE SOFTWARES

PROPOSAL · SEPTEMBER 2026 · JAIPUR · THIS IS NOT A PRICE QUOTE

QR ordering for the café floor

The guest scans the code on the table, orders, pays, and leaves a review. Your staff work from that same order.

Proposed solution

We propose one menu, one order, and one bill for your café.

The guest points a phone at the square code on the table. The code opens that table, not a list of cafés. They see every dish, the price, the extras, and what is finished. They pay on the same screen, by UPI, card, or wallet. We do not keep card numbers. No app to download. Five stars can go to Google. Then they scratch a small gift card that you set.

The kitchen and the counter get the same list. Nobody types the order a second time. The ticket goes to the place that cooks it, such as the grill or the chai counter. You close the table when you say so.

What changes on the café floor

1. The waiter no longer recites the menu. The phone shows it.
2. The order is not written again for the kitchen. The same list becomes the ticket.
3. The guest pays without waiting to be noticed.
4. The counter, the kitchen, and the waiters all see that one order.
5. You choose who may give a discount, and who may give a refund. Each one needs a reason.

Your website, the guest's phone, and the staff screens show the same menu and save the same order. Tax can sit inside the price, or be added on. GST fields are included for an Indian café. A double tap does not create two orders.

Where to start

Start with Floorline. Guests can order while recipes are still being written. Stock waits until the recipes are real. Until then, you keep stock by hand.

PART	WHAT IT COVERS
Tableline The guest's phone	Public menu and a page for each shop. A table code that knows the shop and the seat. Extras, notes, and finished dishes. Pay, a bill, and order status on the phone. A review after payment. Five stars on Google, then a scratch card you fill in. One menu editor for the website, the table, and the counter.
Floorline **Start here**	Everything in Tableline. Billing at the counter, for dine-in and takeaway. Discounts only for the people you allow. Kitchen tickets split by where the dish is cooked. Table status for the waiters. Refunds with a reason. Print the bill, or share it. Logins for cashier, floor, kitchen, and manager.
Estateline When recipes are real	Everything in Floorline. Suppliers, and the bills you get from them. A sale uses the amounts in the recipe. Waste, stock counts, and a gap you have approved. A warning when stock is low, or a dish must go off the menu. Reports where the numbers match. More shops on the same setup.

Not included

- Delivery drivers and routes
- Staff salaries and full accounts
- Paying franchise partners their share
- Gift cards and memberships, unless you ask later
- Writing your menu, or typing your daily sales
- Buying or fitting machines, printers, or screens

Done means a new guest can order, the kitchen can cook it, and the bill matches.

Why this is needed

A full café can still lose money. This is not theft, and it is not lazy staff. A spoken menu drops a little of every order.

- **The menu is spoken.** Guests order only what they heard. The second samosa is never offered.
- **The order is written again.** Each time it is passed on, an extra is dropped. The kitchen should cook what the guest tapped.
- **The table waits to pay.** The food is done. The seat earns nothing until the bill comes.
- **Nobody asks for a review.** They will tap once on the bill. They will not look for a review page from the car.
- **A busy day is not closed.** Discounts, refunds, and stock need one record. If not, the next morning is a guess.

Money

Each gain is small. None of them needs a new guest to walk in the door.

How the money comes in

- Phone orders get bigger, because the guest sees the extras. That is +16% on those orders only.
- A full room seats more groups, because the table frees up sooner. That is +8%.
- Food that was served and left off the bill is billed. That is 1.8%.
- A review is asked on the bill. Extra from reviews starts in month 3.

How these figures change

They stay fixed here. If seats stay empty, the +8% is not counted. Month 1 and month 2 count no extra from reviews. The full effect of reviews is in month 8.

How the work runs

Guests order on the phone at the table first. The counter uses that same order. Stock starts only after the recipes are real. A second shop uses the same system.

- **A bigger bill.** The extra chai and the chutney are on the screen, so more people add them. This applies only to phone orders, at +16%. A ₹420 bill becomes about ₹487. Waiter orders stay the same size.
- **A faster table.** They order and pay without waiting. More groups count only if people are already waiting for a seat, at +8%. That is about 8 more groups for every 100. If seats are empty, this line is zero.

- **The right bill.** What left the kitchen is what was charged. About ₹1.80 in every ₹100 was served and never billed. This puts that money on the bill.
- **Reviews that come in.** Asked on the bill. Month 1 and month 2 count no extra from reviews. It starts in month 3, and the full effect is in month 8. Only a full five stars goes public. A lower score stays with the manager.
- **Staff time back.** Waiters stop walking the menu from table to table. The example saves 2.5 waiter hours a day. Staff are paid by the month. The example pay is ₹25,000 a month. A working day is counted as 8 hours, so 2.5 hours is 2.5 ÷ 8 of that month pay.
- **The next café.** Same system. A new shop. Not a second set of account books.

Numbers

How the money comes in

Sales today are people in a day, times the usual bill, times days open. The extra is added on top.

The example sum

This example is one café. It is not your café. 140 people a day, a usual bill of ₹420, open 26 days.

1. 140 × ₹420 × 26 days is about ₹15.3 L a month. That is sales today, before any extra.
2. Some guests order on the phone. Their bill is bigger. In the example, 65% of orders are on the phone.
3. If every table is full and people are waiting, a faster table means more groups. If seats are empty, this line is zero.
4. Extras that were served and never written on the bill now get billed. Food cost is not taken off this part.
5. From month 3, Google reviews can bring a few more people. The example uses 3%.

Month 1 counts 40% of the extra. Month 2 counts 75%. From month 3 it counts all of it, except reviews, which reach the full rate in month 8.

	IF EVERY TABLE IS FULL	IF SEATS STAY EMPTY
Extra in a busy month	24.3%	15.5%
Extra sales in year one	about ₹39.6 L	about ₹24.6 L

> This is not our price. This is not a promise of extra sales. Food cost in the example is 32% of the extra food sales. A 1.5% payment fee is counted only if you switch it on. Leave it off if you already take UPI. What stays with you is not your final profit. Rent, a franchise share, and the fall in value of machines stay where they are.

Plan

How the work runs

1. A working session. Menu, tables, tax, and who can refund. Then a price. This page is not that price.
2. The table works. Guests scan, order, pay, and review. The kitchen gets the ticket.
3. The counter works. Bills, discounts, receipts, and refunds stay on that same order.
4. Stock, only when the recipes are real. Not before.
5. A second shop on the same system. A phone app only if you want one.

How the money comes in

When the table and the counter work, guests order and pay on the phone. The extra is the bigger phone bills, more groups when the room is full, bills that match, and reviews from month 3.

How the figures change

This part has no rupee total of its own. The example totals are in Numbers. They change only if those inputs change. Month 1 counts 40% of the extra. Month 2 counts 75%. From month 3 it counts all of it, apart from reviews.
